

## ScriptLogic Asset Manager® Quick Scan

Know What Software You Have Installed. Quickly.

**Asset Manager® Quick Scan** is a 30-day, software asset management solution that inventories and automatically categorizes all the software installed on your network. Compare installed software to license agreements to quickly get an overview of software compliance positions.

### OVERVIEW

Asset Manager Quick Scan provides you with a comprehensive overview of what applications are installed and where, quickly giving you a complete overview of your software estate. The overview includes automatic software categorization, including product bundles and families, version and language. Don't wait for a software vendor to knock on your door and request a software audit. Give yourself peace of mind and be able to provide Software Compliance Statements upon request with the Asset Manager Quick Scan.

### PRODUCT INTRODUCTION

Asset Manager Quick Scan provides you with a full inventory and categorized view of all the software running on your network. This solution gathers software details from your workstations, servers, virtual servers and Citrix farms. Simply install Asset Manager Quick Scan on a physical or virtual server on your network; then deploy agents to the devices to be managed and import software license agreements. Asset Manager Quick Scan will inventory, automatically identify and categorize software packages using an extensive software recognition database. Finally, generate reports using the Asset Manager report builder; you will receive a comprehensive overview of your installed software and license compliance positions.

### KEY BENEFITS

#### KNOW WHAT SOFTWARE YOU HAVE INSTALLED – IN 30 DAYS

Asset Manager will discover and inventory all of your organization's software assets with data from Add/Remove programs, file scans, and WMI. Using multiple methods to find software assets dramatically increases the accuracy of the inventory information.

#### SAVE TIME WITH AUTOMATIC SOFTWARE RECOGNITION

Asset Manager automates software recognition by comparing your software inventory data to a robust, software identification database. Asset Manager will identify and categorize more than 85% of all software found (including product families and bundles) without any manual intervention.

#### ACHIEVE SOFTWARE COMPLIANCE

Easily manage your software assets and license agreements from a single solution. Reconcile your installed software with their respective license agreements to ensure that all product use rights are understood (including upgrade/downgrade rights and second-use rights). Then, generate reports showing software compliance positions.

#### UNCOVER UNWANTED INSTALLED SOFTWARE

Software is automatically categorized by product families and bundles; commercial software is separated from freeware, trial ware, hotfixes and more. Quickly discover and report on unwanted or unlicensed software installed on your network.

#### MANAGE LICENSES IN VIRTUAL ENVIRONMENTS

Asset Manager's connectors to VMWare® ESX and Citrix® take the trickiness out of license management in virtual environments.

## USE CASE SCENARIOS

- Get a full, categorized view of your software estate.
- Uncover unwanted software installations.
- Help set realistic IT budgets.
- Determine software license compliance positions.
- Discover software information from Windows and Mac computers.
- Automatically identify product families, bundles and version levels.
- Store and organize purchase information including licensing agreements and contracts.
- Track product use rights.
- Manage software licenses in virtual server and desktop environments.
- Use over 120 pre-defined reports or customize using the built-in report builder for almost any scenario.
- Integrate with Active Directory to import computers, users and other organizational data.
- Import software inventory data from SMS/SCCM or Altiris database.

## LICENSING

Asset Manager Quick Scan Edition is licensed by the number of workstations and servers managed.

## KEY FEATURES

### INTELLIGENT SOFTWARE RECOGNITION

Automatically identify and categorize more than 85% of software found using a “software DNA” database of more than 200,000 software packages, including bundles, so that you can even differentiate between editions of common software.

### LICENSE MANAGEMENT

Import software license agreements and link them with the applications that are installed. Ensure that all product use rights are understood, including upgrade/downgrade rights and second-use rights. Receive complete visibility into your licensing positions to ensure optimal use of licenses.

### SUPPORT FOR BOTH WINDOWS AND MAC OS

Captures full software and hardware inventory from both Windows and Mac OS devices.

### COMPLETE COMPLIANCE REPORTING

Asset Manager has over 120 pre-defined reports including installed software, license compliance and more. If there are questions about the software on your network, Asset Manager has a report with the answer.

### ACTIVE DIRECTORY INTEGRATION

Leverage OU, Group and Site information for compliance reporting. In a scenario of 100 licenses, the Pittsburgh office may be assigned 10 Photoshop licenses but are actually using 18 licenses. Asset Manager can help you identify this overage, where standard compliance reports wouldn't.

### VMWARE® INTEGRATION

The VMWare ESX Connector is a service that communicates directly with VMware's API via ESX/ESXi Server or vCenter. Asset Manager displays the relationship between the application running on a virtual machine and the physical host on which the VM is running.

### CITRIX® XENAPPTM INTEGRATION

The Citrix Connector tracks the relationships between which user is starting up which published application or published desktop and who has the rights to start each Citrix application.

### SCCM & ALTIRIS INTEGRATION

If you're already using SCCM or Altiris, there is no need to install agents. Asset Manager will collect data directly from the software databases in those products.
